Jennifer Lentz Coral Reef Ecology 1

Introduction to Coral Reefs

Coral Reef Ecosystems

Key for coral reef habitat

1 black-capped petrel	16 nudibranch
2 sea urchin	17 nudibranch
3 angelfish	18 sponges
4 lobed corals	19 colonial funnel
5 sea urchins and soft corals	20 giant clam
6 triggerfish	21 purple pseudochromid fish
7 sea fans	22 coast sea star
8 tube anemone	23 soft corals
9 orange stone coral	24 basket pole shrimp
10 bryozoans	25 sea anemones
11 brain coral	26 clown fish
12 butterfly fish	27 worm tubes
13 moray eel	28 cowrie
14 cleaner fish	29 sea fan
15 tube corals	

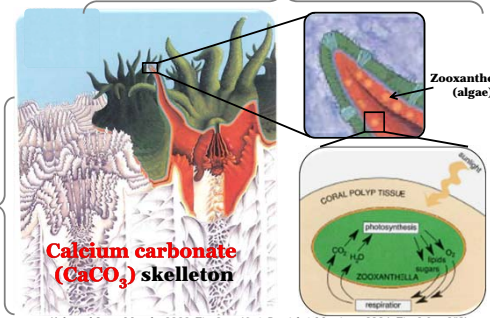

(Garrison 2007; Fig. 16.2 (a-b); p. 460-461)

Jennifer Lentz Coral Reef Ecology 2

“Coral Reefs”

Geologic Context

Biologic Context

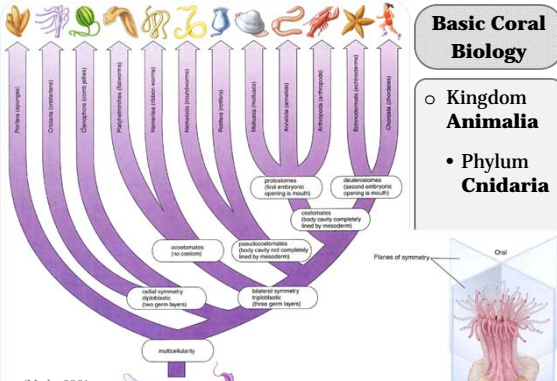

Zooxanthellae (algae)

Calcium carbonate (CaCO₃) skeleton

(Adapted from: Murphy 2002, Fig. 2, p. 46; & Sumich & Morrissey 2004; Fig. 9.6; p.258)

Jennifer Lentz Coral Reef Ecology 3

Basic Coral Biology

Kingdom Animalia

- **Phylum Cnidaria**

Planes of symmetry

(Mader 2001; Fig. 21.1; p. 260)

Jennifer Lentz Coral Reef Ecology 4

Biological Context of Reefs

Cnidarian Life Cycles

Life Cycle is 1 to 2 Phases

- Many only have 1 phase (Polyp or Medusa)
- When both are present...
 - Phase 1= Polyp (asexual phase)
 - Phase 2= Medusa (sexual phase)

Anthozoa

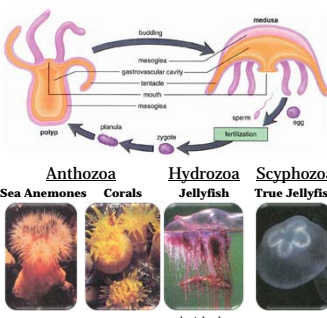

- Sea Anemones: **solitary** polyps
- Corals: **colonial** polyps (usually)

Hydrozoa

- Jellyfish

Scyphozoa

- True Jellyfish

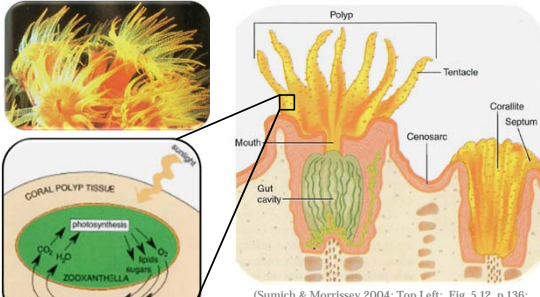

(Mader 2001; Fig. 21.4; p. 266)

Jennifer Lentz Coral Reef Ecology 5

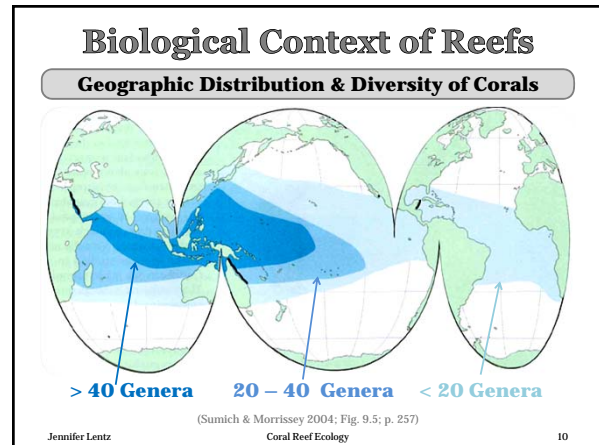

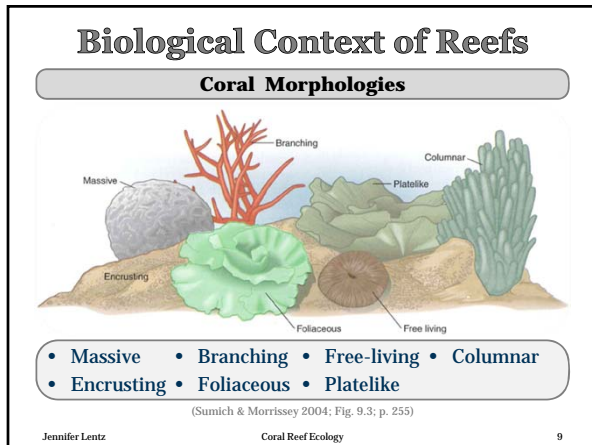

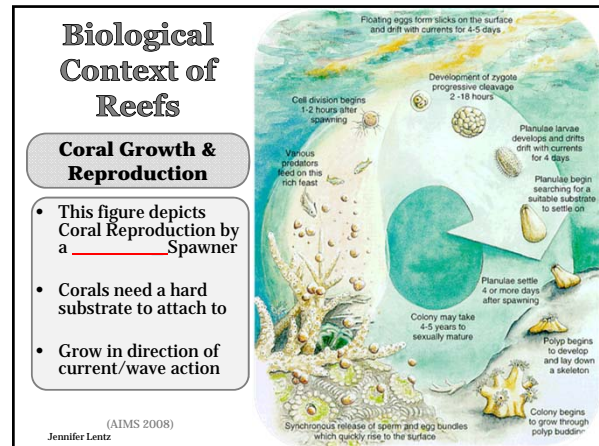

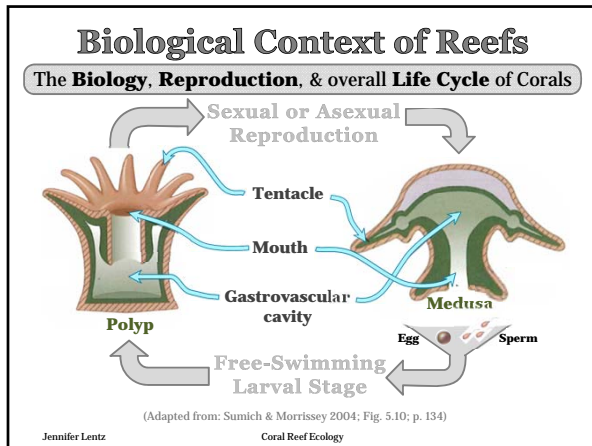

Biological Context of Reefs

Basic Coral Biology

(Sumich & Morrissey 2004; Top Left: Fig. 5.12, p.136; Right: Fig. 9.2, p. 255)

Jennifer Lentz Coral Reef Ecology 6

Geological Context of Reefs

Types & Evolution of Coral Reefs

- **Fringing Reefs**
 - Cling to land
 - Areas with low rainfall & clear water
- **Barrier Reef**
 - Separated from land by a _____
 - Great Barrier Reef is the largest structure made by living organism (135,000 mi²)
- **Atolls**
 - Ring-shaped island of coral reefs surrounding a lagoon
 - **Formation:** Volcano → Fringing reef → Barrier reef → Atoll
 - > 1000 feet of coral fragments beneath present reefs

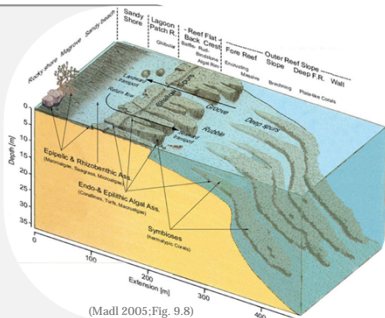

Jennifer Lentz Coral Reef Ecology (Figures: Tackett & Tackett 2002; p. 31) 13

Geological Context of Reefs

Types & Evolution of Coral Reefs

- **Spur & Groove Formations**
 - Adaptation to _____ & _____
 - Mechanism for Sediment _____ during storms

Jennifer Lentz Coral Reef Ecology (Madl 2005; Fig. 9.8) 14

Importance of Coral Reefs

- Protection from Wave Erosion
- Mitigate Hurricane Damage
- Base of the food chain, providing habitat & protection
- Economic reasons – Food/Tourism
- Enhances Quantity & Quality of Life
- Beauty

Jennifer Lentz Coral Reef Ecology 15

Current Status of Corals

Past

Present

Fig. 3.15a: Images from a Caribbean coral reef. Major storm events change a reef from a more or less intact community to one dominated by dead coral, algae and bioeroders. Jennifer Lentz Coral Reef Ecology (Madl 2005; Fig. 3.15a) 16

Coral Stressors

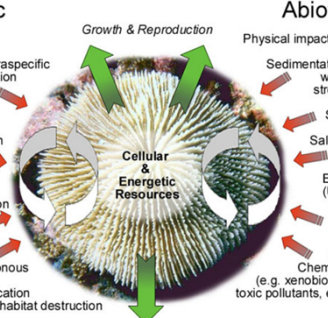

Biotic

- Inter-/Intraspecific Competition
- Predation
- Bioerosion
- Allochthonous species
- Eutrophication
- anthrop. habitat destruction

Abiotic

Physical impact by:

- Sedimentation, wave stress,
- SST
- Salinity
- EMR (UV, Vis, IR)
- and Chemical
- toxic pollutants, etc.)

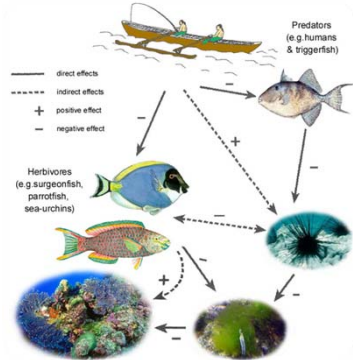

(Madl 2005; Fig. 4.1)

Jennifer Lentz Coral Reef Ecology 17

Coral Stressors

Over-fishing

“Herbivorous feeding pressure: Since herbivorous fish and sea urchins consume algae any fishing pressure exerted on these species by humans does interfere with the sensitive balance of feeding pressure and algal blooms”

(Madl 2005; Fig. 3.7)

Jennifer Lentz Coral Reef Ecology 18

Coral Stressors

Dynamite or Blast fishing

Fig 3.8a: Dynamite or blast fishing is a practice in which fishermen use explosives to kill and harvest fish. Although it is illegal, it is practiced in many countries worldwide and is a major threat to coral reefs. The explosion, which indiscriminately kills all fish within the blast radius also destroys living coral. An explosion the size of a coke bottle will shatter to pieces all stony corals within a three meter radius. Repetitive blasting in an area reduces coral to rubble, which cannot support marine life. (Madl 2005; Fig. 3.8a)

Jennifer Lentz Coral Reef Ecology 19

Coral Stressors

Cyanide-fishing

Fig 3.8b: Although the practice has been outlawed in most countries, and despite many importers of reef fish refuse to accept cyanide-laced fish, widespread use of cyanide continues to devastate huge areas. (Madl 2005; Fig. 3.8b)

Jennifer Lentz Coral Reef Ecology 20

Coral Stressors

Hydrocarbon Pollution from Oil Spills

Fig 3.10a: Crude oil polluting reefs in the Caribbean (left), oil washing on the coast of the northern Gulf of Aqaba / Eilat following an oil spill (right). (Madl 2005; Fig. 3.10a)

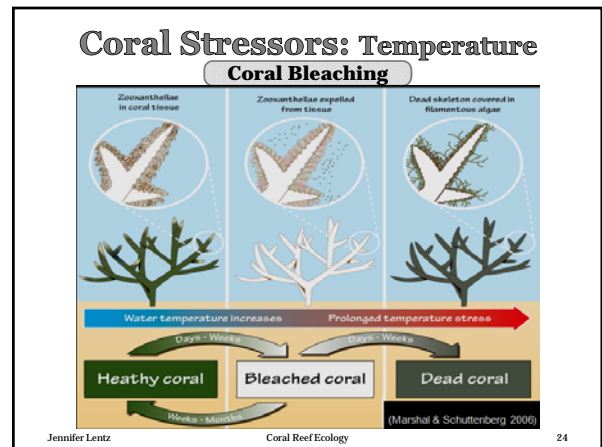

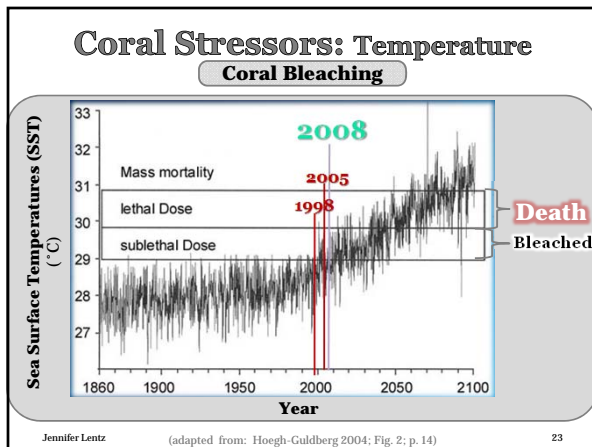

Jennifer Lentz Coral Reef Ecology 21

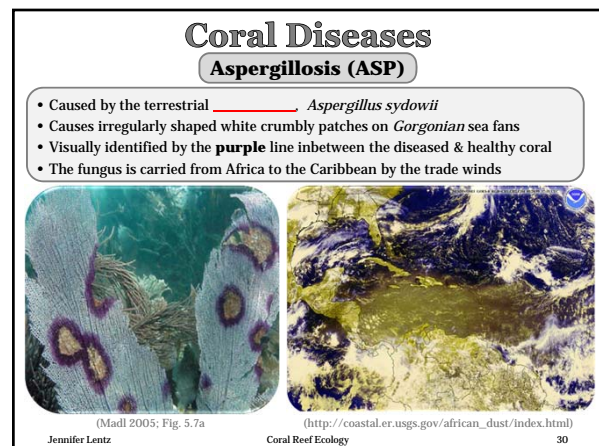

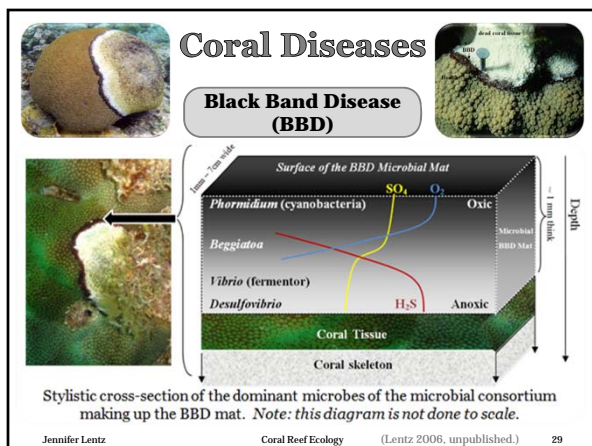

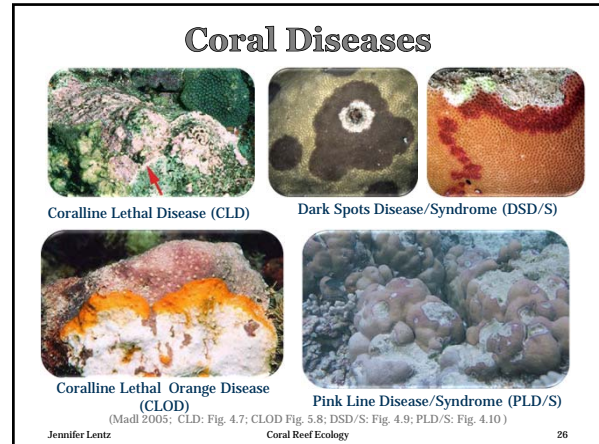

Coral Stressors

Sedimentation

Fig 3.4b: Nutrient pollution and sedimentation from coastal development blocks sunlight, thereby reducing the coral's viability. (Madl 2005; Fig. 3.4b)

Jennifer Lentz Coral Reef Ecology 22

What can be done?

- Marine Reserves- preserve breeding stocks!
- No Anchoring
- Reduce stressors – pollution, sediment, cruise ships!
- Ban humans after bleaching events
- Seed reefs with fast growing *Acropora* spp.
- Re-introduce *Diadema* urchins
- Clean algae off dead corals to increase
- Create Artificial hard substrate for coral recruitment

Jennifer Lentz Coral Reef Ecology 31

Positive Note

Flower Garden Banks National Marine Sanctuary

- 110 miles from coast
- 66 ft-150 ft deep
- No anchoring
- No discharges
- Fishing by hook/line
- No take zone
- Reefs Healthy and provide breeding stock for Caribbean reefs
- Bathed in Loop Current
- Warm Eddy water

Jennifer Lentz Coral Reef Ecology 33

Quiz # 14

➤ **Question:**

What is the **name of the chemical compound** that corals secrete to form their “skeleton,” making up the geologic framework or structure of reefs?

➤ **Answer:** _____
